Script Idea:

- I want to make a script that would calculate the users chances of them and their family/friends wanting to eat the same meal or at the same place, which would show them why the app would be useful. I would put this on my homepage to add some more to it because it could be seen as boring or bland.

Goal:

- To get users to understand why this app is useful. It will enhance user experience and provide some useful information to them

Task Breakdown:

- Make a form for a user to submit with a section for how many friends/family they want to eat with and a section for how many restaurants are around them
- Make a button that when pressed:
    - Collects the users answers for both questions
    - Divides the number of people by number of restaurants
    - Displays the percent chance of them wanting to eat at the same place
