

Business Idea Types

Which type of ideas do you think apply to Shyp? Why?

- I would say Virtualize and Me Too. Virtualize because it is essentially an online yard sale, everyone has a phone with a camera and some stuff they want to get rid of. Me Too because it takes the mailing or Amazon idea and makes it simpler for people who may not want to deal with all the hassle of shipping something out.

Which type of ideas do you think apply to Curofy? Why?

- I want to say just Remix for this one, mostly because he literally says in the video that it's LinkedIn for doctors. It behaves the exact same way but just caters to doctors. If not remix then maybe Me Too for the same reasons.

Product Hunt Questions (LiveGrid):

- Allows you to watch multiple live streams in one grid on the same screen
- Simplify is the only idea that applies because it simply makes viewing multiple streams easier
- I would say this is more of a vitamin because no one really NEEDS this idea, it's more of a quality of life thing that could be added to other services like YouTube or Twitch
- It is very easy to monetize as pro features allow you to watch more streams and engage with the streams directly from the service. The creator could even have ads run somewhere if they really wanted to
- The idea is very simple and easy to describe: your favorite live streams all on one screen
- The idea is not personally relevant to me or anyone I know as we do not watch live streams at all unless it's a particular event, in which we only need one livestream up anyways.
- I would say the idea definitely has a good sized market, like maybe medium. I say this because a good chunk of people that watch twitch/youtube streams watch multiple people and would like to support them at the same time. But the average person wouldn't be using this.
- I don't think there is a secret sauce that anyone can see. If there is one, it's making sure that all the streams run smoothly and don't eat up all your devices resources.

Finding Your Product

Brainstorming:

- Problem: Missing an album/movie/game release
 - Solution: an auto generated calendar based on your interest that reminds you when an album/movie/game is coming out
- Problem: Tracking your trading cards
 - Solution: a scanner that scans and immediately adds your card to a collection/inventory
- Problem: Wasting time/procrastinating
 - Solution: After spending a certain amount of time on an app/program for a day/week, remind the user of something they could've done in that time (watch a movie, watch x episodes of x, do 20 pushups, etc.)
- Problem: Missing an item in a changing in-game shop
 - Solution: notify users when the item ID shows up in the shop so they don't have to keep checking/miss the item
- Problem: Scheduling times to hang out with friends
 - Solution: put everyone's calendars together and decide which days are best to hang out, notify users when the hangout is coming up soon
- Problem: Everyone in the house has different eating preferences
 - Solution: tracks eating preferences and offers meals/restaurants that would cater to everyone

Choose one of your ideas. Why did you pick this idea over the others?

- I'm going to choose the eating preferences idea. I chose this over the others because it has the most relevance to me and people I know and I also feel that it would be pretty easy to monetize and get off the ground. It's closer to a pain killer too, I feel like the majority of the others are vitamins.

Is your idea a new one or has it existed before?

- I believe this is a brand new idea, I've never heard of anything like this before.

What industry would your idea be useful in? Why?

- It would be useful for food and advertising. Food because it would have people cook/eat new foods that cater to everyone in the setting. This also ties into advertising because it could advertise restaurants that have a menu with options that cater to everyone as well.

Product Proposal:

Describe your product and what types of ideas that apply to it.

- My product is a website/app that helps users decide on what to eat when everyone has different eating preferences. I would say it fits into Simplify and Remix. Simplify because it makes the process of figuring out what to eat very simple. Remix because it would take some processes from social media/dating apps to cater to the users.

How is your product personally relevant to you?

- My product is relevant to me because I live in a home with a large family and everyone eats a little different. My mom doesn't eat meat, my sisters are picky, my dad is indifferent to most things, and I have a baby brother. So it can be a mess for my mom to figure out what to cook or order for everyone. The same thing applies to my friends, we all like to eat different things.

What problem will your product solve?

- My product will make the decision on what to eat very simple for users. All they would have to do is pick what recipe/restaurant they want to go to.

What type of website will your product be?

- My product would be a brochure site to demonstrate what the product is, who it's for, and how exactly it works.

Is your product a painkiller or a vitamin?

- I definitely think it's a painkiller for people who cook a lot for their family or roommates, but more of a vitamin for friends who are just indecisive. Overall more of a painkiller.

Is your product easy to monetize?

- I would say so. You could lock a certain number of people/households behind pro features. AI suggestions could be pro features as well. Ads could easily run somewhere on the app and there could be collaborations with certain restaurants to encourage users to go there.

Is your product simple and easy to describe?

- Yes. It's like if your family had a dating app for food. You just set up everyone's preferences and pick a recipe you like, or have the app pick one for you.

Who will be the likely users of your product? Does your product have a large market?

- I would say the likely users are people anywhere between 20-50 that live with a good amount of people or have a decent sized friend group. I would say it does have a large market because there are a lot of people that fall into this category.

Does your product have a legitimate secret sauce?

- The secret sauce would have to be the eventual HUD/UI design and the algorithm that feeds the user food to eat. The main purpose is to not have them think too hard about what to eat.
